

A WORLD WITHOUT BIVALVES

There is a simple experiment to show the importance of these species. All you need are two trays, and a jug. Everything else is on the shore.

Experiment Set Up

1. Fill the two trays with wet sand
2. Place some shells or stone into the wet sand.
3. Tilt the tray (slight enough to allow water to run off)
4. See which tray holds onto the sand?

Discuss the results!
